Volatility Statement for Ethernet and RS-232 Test Systems

JFW Ethernet and RS-232 test systems consists of both non-volatile Flash memory and volatile SRAM. The operating code is stored in 512k of non-volatile Flash memory during manufacturing and is not accessible to the user. The operating code then runs in 512k of SRAM. All variables that are stored when the program is running are stored in 256k of volatile SRAM. Any information that is stored during the operation of the unit is in the volatile SRAM and is cleared when the power is cycled.
